

SPRING FRAMEWORK INTRODUCTION

Spring is the framework . Before Spring there was one framework know as Struts Framework

Struts Framework

By using this framework we can develop only the web applications.

Talk about the Layers of Application

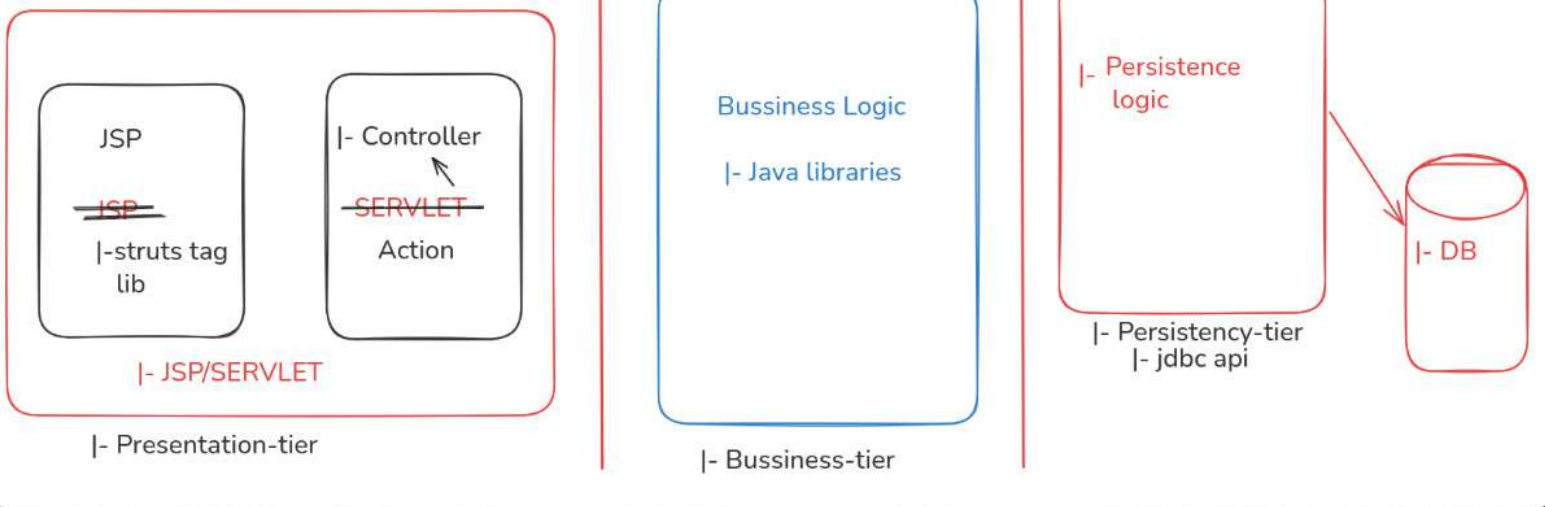

1. Presentation tier
2. Business-tier
3. Persistency-tier

- | - Web application
 - | - Servlet- jsp technologies
 - | - Struts
 - | - SPRING

| - Spring MVC

| - Spring Core
| - AOP

| - Spring JDBC , ORM , DATAJPA

| - Presentation- tier

- Classes which participate in handling the end-user request and response those classes / component is known as presentation-tier component

| - Bussiness- tier

- Classes that participate in performing the business operation those component/classes is known as Bussiness-tier component
- For Example : Applies business rules and makes decisions.
- Balance checking, PIN validation, withdrawal rules

| - Persistency-tier

- | - Classes that acess the data and having the logic to store the data those classes/ components are known as Persistency-tier component.

| - If we are using the Struts Framework the issue is it will work with only the presentation- tier application , for other tier we have to use the java api classes.

| - Struts can only able to work in developing the web application

| - Spring Framework

- | - Standalone Application
- | - Distributed web application
- | - Integration Tier Application
- | - Enterprise application
